Objective: Solve addition and subtraction two step problems in contexts deciding which operations and methods to use and why

## Year 4 Task:

Ally has 56 books in her bookcase. They are either adventure stories or books about dogs. She has 14 more adventure story books than books about dogs.
How many of each type of book does she have?

## Worked example

## Method 1

Adventure books +Dog books = 56 books altogether

|  | Adventure | Dog | Total |  |
| :--- | :---: | :---: | :---: | :---: |
| Guess | 15 | 29 | 44 | too low |
| Guess | 17 | 31 | 48 | too low |
| Guess | 20 | 34 | 54 | too low |
| Guess | 21 | 35 | 56 | correct |

## Method 2

Use a bar model to represent the problem
There are 14 more adventure books compared to dog books

Subtract 14 from 56.
$56-14=42$
Divide 42 between the two types of books
$42 \div 2=21$
So 21 dog books and $21+14$ adventure books
Answer: 21 dog books and 35 adventure books

## Variation

John and Sally are playing a game. They have scored 757 points altogether. Sally has scored 37 more points than John.

How many points has John scored?

## Method 1:

## Method 2:
